

General Description

These devices provide six, two-input buffers in each package. Both the standard (7400 compatible) TTL technology, and the "true tenth-power" (74L compatible) low power versions are available for each of the four types. One of the two inputs to each buffer is used as a control line to gate the output into the high-impedance state, while the other input passes the data through the buffer. The 95 and 97 present the true data at the outputs, while the 96 and 98 are inverting. On the 95 and 96 versions, all six control lines for TRI-STATE enable are common in a single line. On the 97 and 98 versions, four buffers are enabled from a common line, and the other two buffers from a separate common line. In all cases, the outputs are placed in the TRI-STATE condition by applying a high logic level to the control pins. With either the standard TTL or the low power versions of

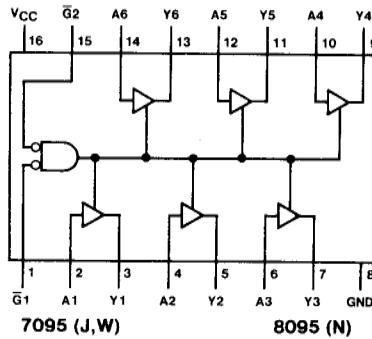

these circuits, it is possible to connect over 100 like devices to a common bus line and still have adequate drive capability.

Features

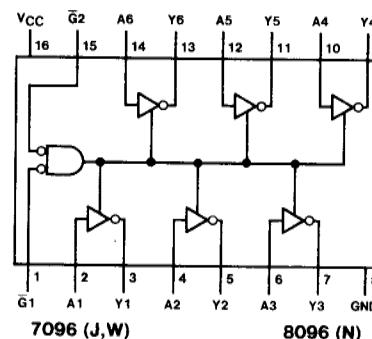

Type	Typical Power Dissipation	Typical Propagation Delay
95, 97	325 mW	12 ns
L95, L97	20 mW	34 ns
96, 98	295 mW	11 ns
L96, L98	15 mW	31 ns
